

# TEXAS STREAM TEAM

at The Meadows Center for Water and the Environment

*Dedicated to understanding and protecting the 191,000 miles of Texas waterways.*

THE MEADOWS CENTER  
FOR WATER AND THE ENVIRONMENT

TEXAS STREAM TEAM

# MISSION:

To facilitate environmental stewardship by empowering a statewide network of concerned citizen scientists, partners, and institutions in a collaborative effort to promote a healthy and safe environment through environmental education, data collection, and community action.

# WHAT WE DO

- Environmental Education
- Data Collection
- Data Use
- Community Action
- Watershed Services

# Texas Stream Team

## Riparian Bull's-Eye Evaluation Training Program

Guided Observation Tools for Evaluating Riparian Areas

## Riparian Assessment Trainings cover an introduction to:

- Riparian principles
- Watershed processes
- Basic hydrology
- Erosion/deposition principles
- Riparian Vegetation
- Potential causes of degradation and possible resulting impairments

# Your Remarkable Riparian

- Field Guide to riparian plants found within most of Texas
- Cultivates awareness and appreciation for riparian plants and the role they play in the production of abundant, clean water
- Used as a companion to complete and submit forms with one to four photos to report observations to Texas Stream Team

# Riparian Bull's-Eye Evaluation Tool

Ten riparian indicators to guide your eye in assessing riparian landscapes for their function and identifying activities that may be hindering the natural riparian recovery process <sup>7</sup>

# The Bull's-Eye Zones

Evaluating Riparian Health using the bull's eye method and ten indicators

<h1 style="text-align: center;">RIPARIAN INDICATORS</h1>	<h2 style="text-align: center;">OUTER ZONE</h2> <p style="text-align: center;">Poor, Dysfunctional Condition</p>	<h2 style="text-align: center;">MID ZONE</h2> <p style="text-align: center;">At-Risk Condition</p>	<h2 style="text-align: center;">BULL'S-EYE</h2> <p style="text-align: center;">High Functional Condition</p>
<p><b>1. Active Floodplain</b> <i>Does floodwater have access to a floodplain?</i></p> <p>Look for recently deposited debris or silt from recent floods.</p>	<p>Limited or no apparent floodplain where floodwater can spread out and slow down.</p>	<p>Floodplain too far above channel to be very effective.</p>	<p>Floodplain clearly defined, allowing for floodwater to overflow channel, spread out, and slow down.</p>
<p><b>2. Energy Dissipation</b> <i>Is there enough "stuff" in channels, on banks and in the floodplain to dissipate flood energy?</i></p>	<p>Not many energy dissipating features in the channel, on the banks, or in the floodplain.</p>	<p>Only some energy dissipating features present.</p>	<p>Abundance of energy dissipaters present in the channel, on the banks, and in the floodplain.</p>
<p><b>3. New Plant Colonization</b> <i>Are new plants successfully colonizing on fresh sediment?</i></p>	<p>Not much colonization; sediment deposits and point bars are bare.</p>	<p>Only some new plant colonization are on fresh sediment.</p>	<p>Abundance of new plants colonizing on fresh sediment.</p>
<p><b>4. Stabilizing Vegetation</b> <i>Are banks covered with strong stabilizing plants—those with a stability rating (SR) of 6 or greater?</i></p>	<p>Not much of bank is covered with stabilizing vegetation and tree roots.</p>	<p>Some gaps present and/or some vegetation lacks sufficient stability rating.</p>	<p>Banks covered with stabilizing vegetation.</p>
<p><b>5. Age Diversity</b> <i>Are young, middle-aged and mature riparian plants present?</i></p>	<p>Few to no young and middle-age trees, shrubs, riparian grasses or sedges.</p>	<p>Only a few young and/or middle-age riparian plants present.</p>	<p>In addition to older riparian plants, young and middle-aged plants are abundant.</p>

<p><b>6. Species Diversity</b>  <i>Are several key, native riparian plant species present?</i></p>	<p><b>No or low diversity:</b>  Only 1–2 native species of riparian trees, shrubs, and/or only 1–2 grasses and sedges.</p>	<p><b>Modest diversity:</b>  3–4 species of native riparian trees, shrubs, and/or 3–4 grasses and sedges.</p>	<p><b>More than 5 different species</b> of native riparian trees, shrubs, and/or more than 5 species of grasses and sedges.</p>
<p><b>7. Plant Vigor</b>  <i>Are riparian plants vigorous and healthy?</i>  Consult your Field Guide for information about a particular plant’s palatability for grazing and browsing.</p>	<p><b>Unhealthy riparian plants.</b> Woody plants show signs of heavy or chronic browsing; a severe browse line can be noted. Riparian grasses and sedges compromised by grazing, mowing, or trampling.</p>	<p><b>Low vigor:</b> Woody plants show signs of heavy browsing or hedging; a browse line may be present. Grasses and sedges show signs of heavy use, grazing, mowing, or trampling, only in places.</p>	<p><b>Healthy, vigorous riparian plants.</b> Woody plants show little or no sign of heavy browsing or hedging. Grasses and sedges show little or no sign of heavy grazing, mowing, trampling, or other impairments.</p>
<p><b>8. Water Storage</b>  <i>Are the banks and floodplain storing water?</i>  Use your Field Guide to identify key Wetland Obligate and Facultative Wetland plants.</p>	<p><b>No OBL or FACW species</b> are present, indicating a lack of water being stored in the riparian area.</p>	<p><b>Only a few OBL and FACW plant species</b> present—and only along the stream’s edge.</p>	<p><b>Several wetland plant species</b> present—at water’s edge and out on the floodplain too.</p>
<p><b>9. Bank/Channel Erosion</b>  <i>Are bank and channel erosion balanced with deposition on point bars?</i></p>	<p><b>Continuous, active and extreme bank erosion</b> with no apparent balancing by point bar deposition. Channel may appear either too wide or too deep.</p>	<p><b>Widespread bank erosion,</b> beyond meander bends and not balanced by point bar deposition. Channel looks out of balance.</p>	<p><b>Light and balanced bank erosion</b> on meander bends being compensated by deposition on point bars downstream. Channel appears to be of size and depth to manage sediment.</p>
<p><b>10. Sediment Deposition</b>  <i>Is sediment being deposited in a balanced way—on point bars downstream from eroded banks?</i></p>	<p><b>Clearly excessive</b> amounts of sediment, often in middle of the channel.</p>	<p><b>Some excessive sediment deposition,</b> some mid-channel bars, but otherwise sediment is where it should be, on point-bars.</p>	<p><b>Normal and balanced</b> sediment deposition.</p>

# Active Floodplain

*Does floodwater have access to a floodplain?*

**Inner Zone**

**Good Floodplain Access**

# Active Floodplain

**Outermost  
Zone**

**Floodplain is not very Accessible**

# Energy Dissipation

*Is there enough “stuff” in channels, on banks, and in the Floodplain to dissipate flood energy?*

Photos courtesy of Steve Nelle and Kenneth Mayben.

**Good** energy dissipation

# Energy Dissipation

Photos courtesy of Steve Nelle and Kenneth May

**Middle Zone**

**Not much energy dissipation**

# New Plant Colonization

*Are trapped sediment being successfully colonized  
by new plants?*

No new plant colonization here

# New Plant Colonization

*Are trapped sediment being successfully colonized  
by new plants?*

Plants colonizing fresh sediments

# Stabilizing Vegetation

*Are banks covered with strong stabilizing plants?*

Photos courtesy of Steve Nelle and Kenneth Mayben.

**Good stabilizing cover**

# Stabilizing Vegetation?

Photos courtesy of Steve Nelle and Kenneth Mayben.

**Poor stabilizing cover**

# Stabilizing Vegetation?

Photos courtesy of Steve Nelle and Kenneth Mayben

**Poor stabilizing cover**

# Age Diversity

*Are young, middle-aged and mature riparian plants present?*

No Age Diversity

Good Age Diversity

Photos courtesy of Steve Nelle and Kenneth  
Mark

# Species Diversity

*Are several key, native riparian plant species present?*

Bald cypress, OBL, SR9  
Mexican ash, FAC, SR6  
Cedar elm, FAC, SR6  
Pecan, FAC, SR6  
Red mulberry, FACU, SR6  
Box elder maple, FACW, SR6  
Rough leaf dogwood, FAC, SR6

**Good Species Diversity**

# Species Diversity

*Are several key, native riparian plant species present?*

Eastern gamma, FAC, SR9  
Indian grass, FACU, SR7  
Bulrush, OBL, SR8/9  
Cattail, OBL, SR9  
Spikerush, OBL, SR6/7  
Cottonwood, FAC, SR7

**Good Species Diversity**

# Species Diversity

Little plant diversity here. The riparian area pictured is dominated by bald cypress, OBL, SR9. It is very stable, but a single species is not a safe situation in nature. These cypress trees need some woody understory and some herbaceous cover to support them.

**Poor Species Diversity**

# Plant Vigor

*Are riparian plants vigorous and healthy?*

**Good Plant Vigor**

# Plant Vigor

Poor Plant Vigor

# Plant Vigor

**Bushy bluestem (left) and Buttonbush (above), both palatable browse plants, are showing signs of extreme overgrazing and/ or long-term browsing.**

**Poor Plant Vigor**

# Plant Vigor

Poor Plant Vigor

# Water Storage

*Are the banks and floodplain storing water?*

Good water storage capacity is shown by the presence of:  
Black willow (FACW)  
Emory sedge (OBL)

**Good Water Storage**

# Water Storage

*Are the banks and floodplain storing water?*

**This photo shows upland species  
in the riparian area:  
Live oak (FACU)  
KR bluestem (UPL)**

**No Water Storage**

# Bank and Channel Erosion

*Are bank and channel erosion balanced  
with deposition on point bars?*

**Balanced**

# Bank and Channel Erosion

Photos courtesy of Steve  
Nelle

**Out of Balance**

# Sediment Deposition

*Is sediment being deposited in a balanced way?*

**Sediment Deposition Balanced**

# Sediment Deposition

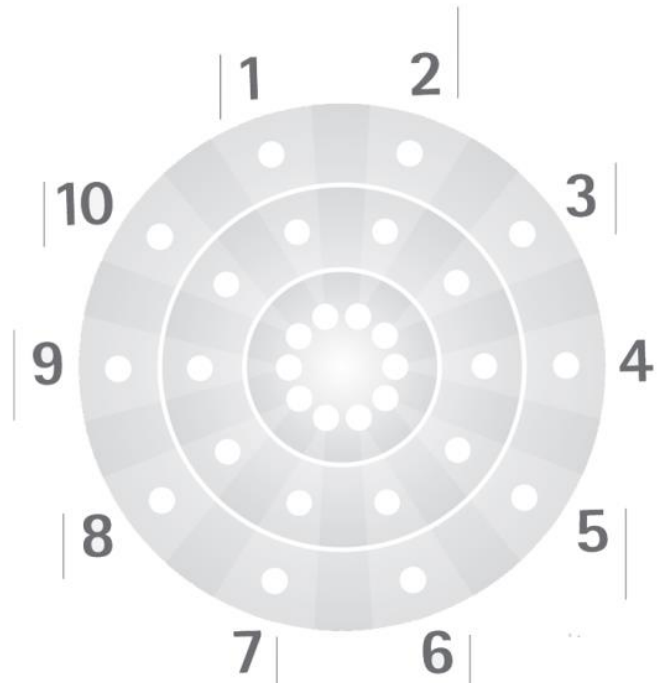

**Sediment Out of Balance**

# Putting it ALL Together

*Observation is a Powerful Tool*

**Riparian site along South Llano River in Kimble County**

**Filling out the Bull's Eye**

**Active Floodplain** – floodplain clearly defined and accessible

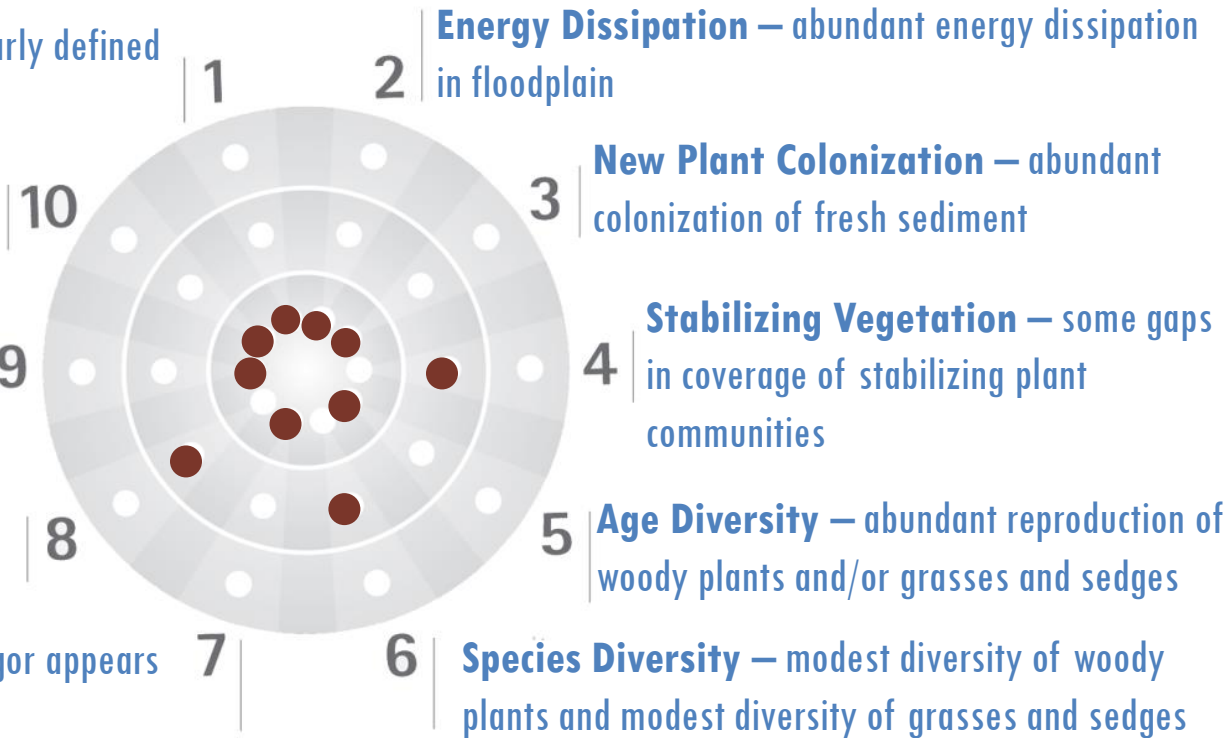

**Energy Dissipation** – abundant energy dissipation in floodplain

**Sediment Deposition** – sediment appears normal and balanced

**Bank/Channel Erosion** – no excessive bank erosion is visible

**Water Storage** – OBL and FACW species are abundant near the water's edge, but not further back

**Plant Vigor** – herbaceous plant vigor appears healthy and vigorous
